

Problem 2

a)

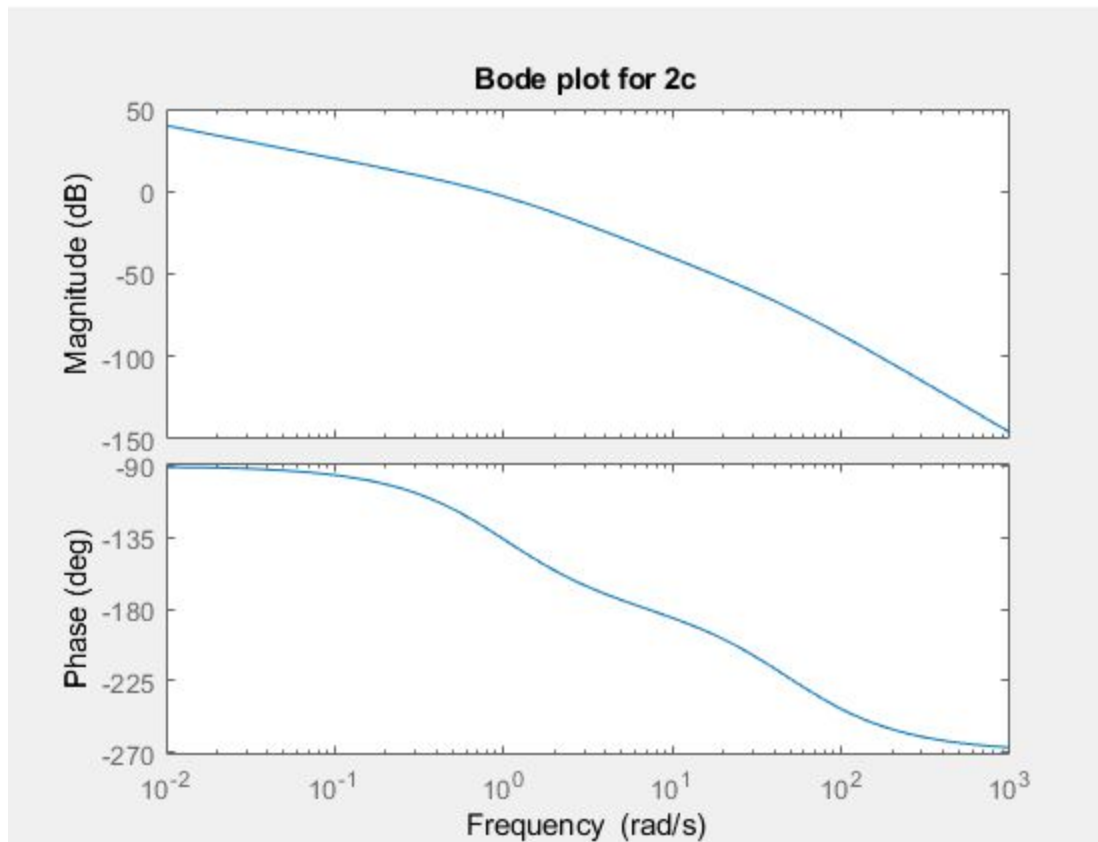

This plot is very similar to my sketch except there are smoother transitions in the actual bode plot. The phase plots look identical.

b)

This plot is very similar to my sketch except there are smoother transitions in the actual bode plot. Between 2 rad/s and 10 rad/s it is harder to discern the transitions on the bode plot because of the scale.

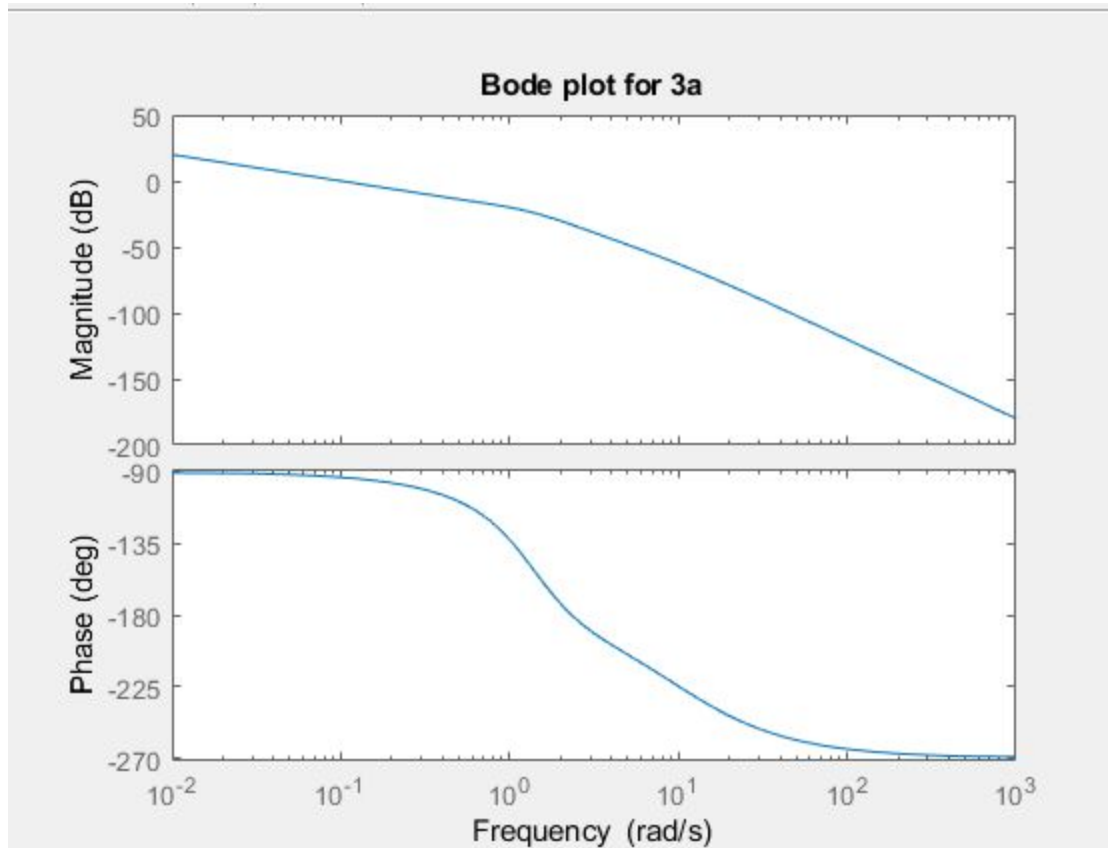

c)

This plot is very similar to my sketch except there are smoother transitions in the actual bode plot. Once again because of the bode plot scale the two “bumps” of the phase plot are not as pronounced as compared to the sketch, but the plots appear the same.

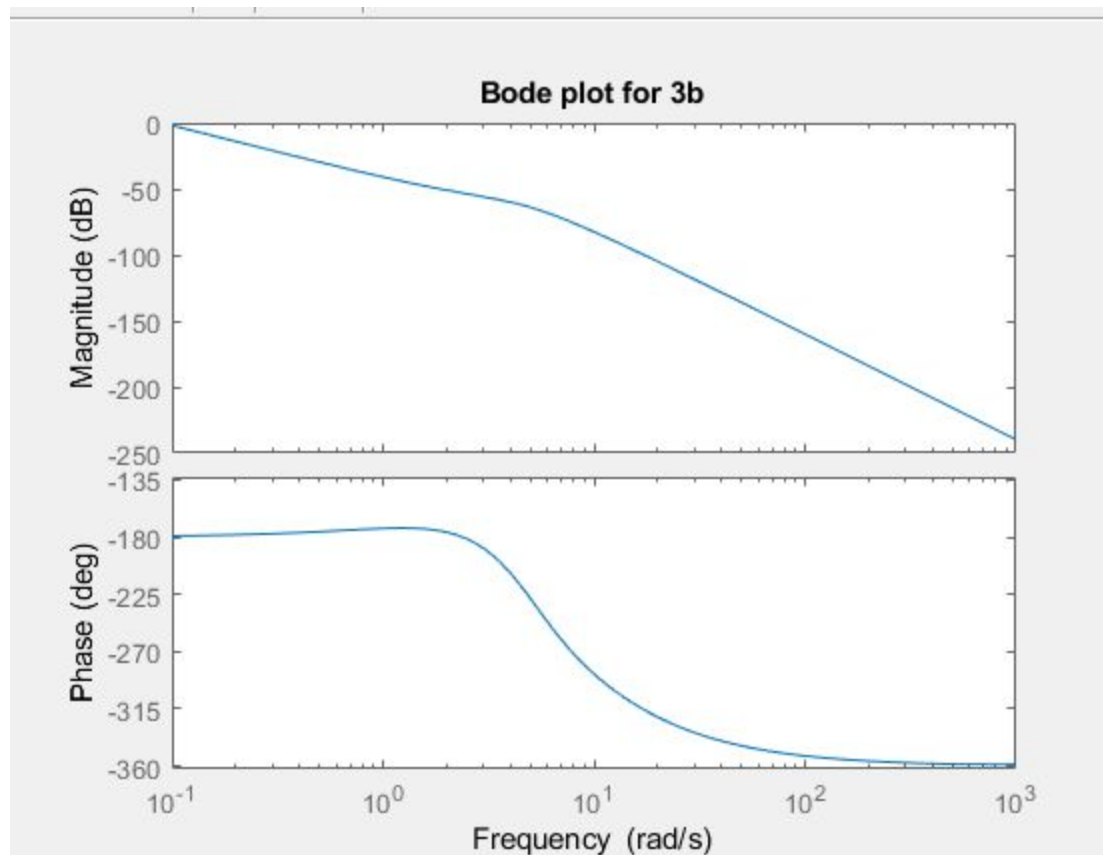

Problem 3

a)

This plot is very close to the sketch I created, although the phase plot and magnitude plot don't show as detailed transitions between 1 rad/s and 2 rad/s when compared to my sketch because of the scale.

b)

This plot is close to my sketch but between .1 rad/s and 1 rad/s the phase plot appears to be increasing on the actual bode plot and this doesn't appear as much on my sketch. This is likely because of the influence of the breakpoint at 2 rad/s beginning to have some influence before the plot reaches that breakpoint.
